

# Hemorrhoid Treatment Using Infrared Photocoagulation (Coagulation Therapy)

**P**iles are very uncomfortable and often painful. Fortunately, there are a lot of remedies available right now - ranging from home remedies to over-the-counter drugs in order to surgical procedures. Mild cases subside on their own as long as the cause is eliminated. Home remedies as well as creams help speed up the process of recovery a bit. For more severe cases, surgical procedure offer the fastest way to get rid of piles. For mild to moderate cases, photocoagulation for **hemorrhoids** is often a non-surgical medical procedure that gives effective and also fast treatment.

Photocoagulation for **hemorrhoids** uses high-intensity infrared light to remove hemorrhoids and it is otherwise known as infrared coagulation. The patient lies on his side with knees drawn towards the torso and the doctor inserts a proctoscope within the anal canal. The hemorrhoid is grasped and an intense beam of infrared light will be directed to its base. The light forms scar tissue that forms a clot. This clot blocks blood flow and suffocates the hemorrhoid right up until it dies and falls out. The scar tissue also hold together the affected veins and prevent them from bulging out of the anus.

## This Treatment Option Presents Permanent and Fast Relief to Most Patients

People who have undergone infrared coagulation have rarely had to come back for further treatments. Those who have suffered from piles but have not found home remedies successful find relief with this option. Results are usually fast and symptoms go away quickly. It is also safe to perform on elderly or sickly patients, which is not always the case for some other medical procedures.

## However, this Option is Painful and Costly

It can be expensive but it is a bit cheaper compared to surgery. The actual process is painful and you might experience soreness after, especially when it comes to peeing and defecating. You may also experience bleeding from the anus after undergoing this treatment. Home coagulation works but bear in mind that piles may develop again. It is also important to note that this treatment is recommended for small piles and only 1 hemorrhoid is treated at a time. An period of 10-14 days in between procedures is advised.

## You are Considering this Treatment Option, Ask Your Doctor about It First

Depending on your case, there may be other options that you should consider before choosing to undergo this process. The doctor's expertise in performing this is also important and success of the whole process depends mainly on this. Serious infection may occur from the procedure so take the time to look for a qualified doctor with proper equipment.

## Aspirin Consumption is Also Disheartened Five Days Before and After Infrared Coagulation

Bleeding occurs up to 10 days after the procedure and you will have to take some time off work for this. Your own stool needs to be softened to avoid further discomfort. To do this, increase your fiber intake or perhaps make use of other stool softeners. To relieve pain, taking sitz baths can help. Your doctor may also prescribe a person with pain relievers if necessary.

HemorrhoidsPilesHemorrhoid

- Just like with any remedy, photocoagulation for hemorrhoids come with risks.
- It is important for you to weigh the pros and cons before undergoing any procedure.
- Depending on the case of your piles, infrared coagulation may well prove to be the best option for you.
